On the Brink

Our planet now teeters on the brink of global environmental disaster. Unlike the previous single event disasters of the past, we, the planet's caretakers, are the culprits sowing an ecological disaster. Hopefully, swift action can prevent us reaping from our previous inaction.

Disturbingly, this seems to be a dogged objective over many decades, as the systematic obliteration of the environment has been tiered and multifaceted. Although not as expedient as an instant planetary catastrophe, this self-made methodical global calamity is just as destructive.

The short-sighted recipe of a carbon-loaded atmosphere, [ocean acidification](#), toxic wastes dumped into waterways, global deforestation, mishaps of nuclear plants, immense oceanic oil spills, and oceanic plastic pollution along with other factors have culminated to inflict mayhem upon our home planet.

Across the scientific spectrum, experts warn that we are now in the midst of a mass extinction event, in real-time, as you read this. This means thousands of animals are dying and whole species are going extinct at an accelerated rate. Scientists say that [1 in 4 mammals](#) living today may soon disappear forever. The statistics are worse for many, as in the case of amphibian life forms, which shall experience increases of 4 in 10.

On a global scale, international laws outlawing sewage and chemical dumping are being presented and established to halt to consistent annihilation of our marine ecosystem. As we get “boots-on-the-ground” many understand that better management will lead to better outcomes. Scientists now agree that drastic measures are needed to prevent the ocean crises.

Here is where we “hold the line.” Join us as we stand as a united front to block and divert the oncoming wave of disaster through strategic cohesive efforts, taken on by OceanSaviours. Join us in this global endeavor. Click the link, <https://www.oceansaviours.com/support-us> to discover more.
